

**NMR-SOLVE METHOD FOR RAPID IDENTIFICATION
OF BI-LIGAND DRUG CANDIDATES**

ABSTRACT

Methods for rapidly identifying drug candidates
5 that can bind to an enzyme at both a common ligand site
and a specificity ligand site, resulting in high affinity
binding. The bi-ligand drug candidates are screened from
a focused combinatorial library where the specific points
of variation on a core structure are optimized. The
10 optimal points of variation are identified by which atoms
of a ligand bound to the common ligand site are
identified to be proximal to the specificity ligand site.
As a result, the atoms proximal to the specificity ligand
site can then be used as a point for variation to
15 generate a focused combinatorial library of high affinity
drug candidates that can bind to both the common ligand
site and the specificity ligand site. Different
candidates in the library can then have high affinity for
many related enzymes sharing a similar common ligand
20 site.
